Héberger ses mails

Ce petit guide est destiné aux jeunes fruités qui ne désirent plus être dépendants des services privateurs des géants du net. Par convention, votre serveur mail s'appellera **mail.domaine.tld** Vous aurez au final:

- la clique postfix / dovecot / rspamd pour gérer le flux des messages
- modoboa pour gérer les comptes
- nginx et uwsgi pour vous servir modoboa et rspamd
- ainsi que pleins de truc cools (sieve, antispam, messages d'absence, calendrier, etc.)

0. Prérequis

1. Savoir se connecter via ssh
2. Savoir utiliser un éditeur de texte
3. Comprendre les bases de l'envoi de messages électroniques par un serveur dédié
4. Savoir créer les enregistrements DNS qui vont bien: SPF, DKIM, PTR, TLSA, etc.
5. Savoir générer un certificat TLS qui tient la route
6. Savoir créer une base Mysql
7. Savoir gérer un pare-feu
8. Et utiliser sudo…

Important: ce guide n'est valide que pour architectures x86 et x86_64 (amd64) puisque rspamd dépend de libluajit qui ne compile correctement sur arm64 qu'avec au minima la version 2.1 et comme Debian Stretch (la version utilisée) n'inclut que la version 2.0, vous en tirerez les conséquences qui s'imposent.

Sources des logiciels:

- Debian Stretch
- Rspamd 1.6.x
- Modoboa 1.9.x

1. La base de travail

On créé un utilisateur vmail qui va se charger de stocker les messages:

```
groupadd -g 5000 vmail
useradd -u 5000 -g vmail -s /usr/bin/nologin -d /home/mail -m vmail
```

On installe les paquets pour postfix:

```
apt install postfix postfix-mysql postfix-pcre
```

puis dovecot:

```
apt install dovecot-imapd dovecot-lmtpd dovecot-managesieved dovecot-mysql
dovecot-pop3d dovecot-sieve
```

puis mariadb:

```
apt install mariadb-server
```

puis nginx et uwsgi:

```
apt install nginx-full uwsgi-python
```

puis redis-server:

```
apt install redis-server
```

puis clamav:

```
apt install clamav clamav-daemon
```

puis rspamd selon les instructions des développeurs car la version de rspamd est trop ancienne dans les dépôts Debian (une vague histoire de javacripts *minifiés* qui ne plaît pas au mainteneur Debian).

et enfin pour modoboa:

```
apt install python-virtualenv python-pip build-essential python-dev libxml2-
dev libxslt-dev libjpeg-dev librrd-dev rrdtool libffi-dev libssl-dev
```

De façon optionnelle: gpg 

2. Installation et configuration de modoboa

2.1. Installation de modoboa via pip

C'est du python et donc il faut mieux travailler dans un *virtual-env* pour ne pas tomber dans le piège des dépendances. Avec votre utilisateur non privilégié il faut passer dans un environnement virtuel pour installer modoboa:

```
virtualenv env
source env/bin/activate
pip install -U pip
pip install modoboa
pip install mysqlclient
```

2.2. Déploiement de modoboa

Ensuite il faut déployer une instance (référez-vous à la documentation pour plus d'explications sur les modules mais amavis pue des fesses):

```
modoboa-admin.py deploy <instance> --collectstatic --domain mail.domaine.tld
--dburl default:mysql://USER:PWD@localhost:3306/DB --extensions modoboa-
dmarc modoboa-imap-migration modoboa-pdfcredentials modoboa-pfxadmin-migrate
modoboa-postfix-autoreply modoboa-radicale modoboa-sievefilters modoboa-
stats modoboa-webmail
```

pour de belles statistiques (utilisateur privilégié au besoin):

```
mkdir <dossier>/modoboa
```

où ce chemin sera renseigné dans l'interface de modoboa.

on n'oublie pas les fichiers nécessaires à postfix via le *virtual-env*:

```
python manage.py generate_postfix_maps --destdir <dossier>
```

Ces fichiers devront être placés dans un sous-dossier du dossier /etc/postfix pour plus de logique. Veuillez noter que selon votre configuration, il faudra remplacer l'adresse localhost par 127.0.0.1 pour éviter quelques soucis.

2.3. Crontab pour modoboa

Le fichier à éditer dans /etc/cron.d/modoboa :

```
#
# Modoboa specific cron jobs
#
PYTHON=/chemin/vers/env/bin/python
INSTANCE=/chemin/vers/instance
# Operations on mailboxes
*       *       *       *       *       vmail   $PYTHON $INSTANCE/manage.py
handle_mailbox_operations 2>&1
# Sessions table cleanup
0       0       *       *       *       root    $PYTHON $INSTANCE/manage.py
clearsessions
# Logs table cleanup
0       0       *       *       *       root    $PYTHON $INSTANCE/manage.py
cleanlogs
# Logs parsing
*/5     *       *       *       *       root    $PYTHON $INSTANCE/manage.py
logparser &> /dev/null
# DNSBL checks
*/30    *       *       *       *       root    $PYTHON $INSTANCE/manage.py
modo check_mx
# Public API communication
0       *       *       *       *       root    $PYTHON $INSTANCE/manage.py
```

```
communicate_with_public_api
# Statistics update
0   *    *    *    *    root    $PYTHON $INSTANCE/manage.py
update_statistics
# Generation of radicale file (from_file) rights
*/2 *    *    *    *    root    $PYTHON $INSTANCE/manage.py generate_rights
--force
```

 Tout n'est pas forcément nécessaire et notamment la dernière ligne.

Par défaut l'interface de configuration de modoboa s'accède via le couple admin/password

3. Postfix

3.1. main.cf

Pour postfix c'est assez simple, le main.cf (avec une mise en forme qui plairait à hardware):

```
########################
## GENERALS SETTINGS ##
########################

smtpd_banner         = $myhostname ESMTP $mail_name
compatibility_level  = 2
biff                 = no

```

3.3. Complément DMARC

Il faut ajouter le fichier suivant dans /etc/postfix/modoboa:

```
adresse_dmarc_enregistrement_DNS@domaine.tld dmarc-rua-parser:
```

puis un coup de postmap bien placé:

```
postmap /etc/postfix/modoboa/dmarc_transport
```

4.Dovecot

4.1. Configuration générale

La configuration générale de dovecot dans /etc/dovecot/conf.d se fait de cette façon:

>/etc/dovecot/conf.d/10-auth.conf<

```
disable_plaintext_auth = no
auth_cache_ttl = 1 hour
auth_username_chars =
abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZ01234567890.-_@
auth_mechanisms = plain login
!include auth-sql.conf.ext
```

>/etc/dovecot/conf.d/10-director.conf<

```
service director {
  unix_listener login/director {
  }
  fifo_listener login/proxy-notify {
  }
  unix_listener director-userdb {
  }
  inet_listener {
  }
}
service imap-login {
}
service pop3-login {
}
protocol lmtp {
}

log_path = /var/log/dovecot/dovecot.log
info_log_path = /var/log/dovecot/dovecot-info.log
auth_verbose = yes
auth_verbose_passwords = sha1
plugin {
}
log_timestamp = "%Y-%m-%d %H:%M:%S"
```

>etc/dovecot/conf.d/10-mail.conf<

```

```
passdb {
  driver = vpopmail
  args =
}
userdb {
  driver = vpopmail
  args = quota_template=quota_rule=*:backend=%q
}
```

4.2. Gestion de la db

Les autres fichiers utiles tels

>/etc/dovecot/dovecot-dict-auth.conf.ext<

```
default_pass_scheme = MD5
iterate_prefix = userdb/
key passdb {
  key = passdb/%u
  format = json
}
key userdb {
  key = userdb/%u
  format = json
}
key quota {
  key = userdb/%u/quota
  default_value = 100M
}
passdb_objects = passdb
userdb_objects = userdb
userdb_fields {
  quota_rule = *:storage=%{dict:quota}
  mail = maildir:%{dict:userdb.home}/Maildir
}
```

>/etc/dovecot/dovecot-dict-sql.conf.ext<

```
connect = host=127.0.0.1 dbname=DB user=USER password=PWD
map {
  pattern = priv/quota/storage
  table = admin_quota
  username_field = username
  value_field = bytes
}
map {
  pattern = priv/quota/messages
  table = admin_quota
  username_field = username
  value_field = messages
}
map {
  pattern = shared/expire/$user/$mailbox
  table = expires
  value_field = expire_stamp
  fields {
    username = $user
    mailbox = $mailbox
  }
}
```

>/etc/dovecot/dovecot-sql.conf.ext<

```
driver = mysql
connect = host=127.0.0.1 dbname=DB user=USER password=PWD
default_pass_scheme = CRYPT
password_query = SELECT email AS user, password FROM core_user WHERE
email='%Lu' and is_active=1
user_query = SELECT '/home/mail/%Ld/%Ln' AS home, 5000 as uid, 5000 as gid,
concat('*:bytes=', mb.quota, 'M') AS quota_rule FROM admin_mailbox mb INNER
JOIN admin_domain dom ON mb.domain_id=dom.id WHERE mb.address='%Ln' AND
dom.name='%Ld'
iterate_query = SELECT email AS user FROM core_user
```

4.3. scripts utiles

Il faut aussi des scripts utiles:

>/usr/local/bin/postlogin.sh <

```
#!/bin/sh

DBNAME=DB
DBUSER=USER
DBPASSWORD=PWD

echo "UPDATE core_user SET last_login=now() WHERE username='$USER'" | mysql
-u $DBUSER -p$DBPASSWORD $DBNAME

exec "$@"
```

>/usr/local/bin/quota-warning.sh<

```
#!/bin/sh
PERCENT=$1
USER=$2
cat << EOF | /usr/lib/dovecot/dovecot-lda -d $USER -o
"plugin/quota=maildir:User quota:noenforcing"
From: postmaster@domaine.tld
Subject: quota warning

Your mailbox is now $PERCENT% full.
EOF
```

4.4 antispam

Pour l'antispam, je propose ceci, proche de la configuration officielle dovecot:

>/usr/local/dovecot/sieve/report-ham.sieve<

```
require ["vnd.dovecot.pipe", "copy", "imapsieve", "environment",
"variables"];

if environment :matches "imap.mailbox" "*" {
  set "mailbox" "${1}";
}

if string "${mailbox}" "Trash" {
  stop;
}

if environment :matches "imap.user" "*" {
  set "username" "${1}";
}

pipe :copy "sa-learn-ham.sh" [ "${username}" ];
```

>/usr/local/dovecot/sieve/report-spam.sieve<

```
require ["vnd.dovecot.pipe", "copy", "imapsieve", "environment",
"variables"];

if environment :matches "imap.user" "*" {
  set "username" "${1}";
}

pipe :copy "sa-learn-spam.sh" [ "${username}" ];
```

>/usr/local/dovecot/sieve/sa-learn-ham.sh<

```
#!/bin/bash

# rspamd client reads piped ham message from the standard input
exec /usr/bin/rspamc -h localhost:11334 -P "q1" learn_ham
```

>/usr/local/dovecot/sieve/sa-learn-spam.sh<

```
#!/bin/bash

# rspamd client reads piped spam message from the standard input
exec /usr/bin/rspamc -h localhost:11334 -P "q1" learn_spam
```

5. nginx et uwsgi

5.1. configuration du domaine principal

Le domaine principal mail.domaine.tld sera configuré de cette façon:

```
server {
        listen 80;
#        listen [::]:80 ipv6only=on;
        root /chemin/vers/modoboa/<instance>/<instance>;

        # Make site accessible from http://localhost/
        server_name mail.domaine.tld localhost;

        if ($ssl_protocol = "") {
                rewrite ^/(.*)   https://$server_name$request_uri?
permanent;
        }
}

server {
    listen 443 ssl http2;
#    listen [::]:443 ssl http2;
    ssl on;
    keepalive_timeout 70;

    server_name mail.domaine.tld localhost;
    root /chemin/vers/modoboa/<instance>/<instance>;

    ssl_certificate /chemin/vers/fichier.crt;
    ssl_certificate_key /chemin/vers/fichier.key;

    access_log  /var/log/nginx/modoboa.access.log;
    error_log /var/log/nginx/modoboa.error.log;

    location /sitestatic/ {
            autoindex on;
            alias /home/modoboa/instance/sitestatic/;
    }

    # Whether or not Modoboa uses a media directory depends on how
    # you configured Modoboa. It does not hurt to have this.
    location /media/ {
            autoindex on;
            alias /home/modoboa/instance/media/;
    }

    # This denies access to any file that begins with
    # ".ht". Apache's .htaccess and .htpasswd are such files. A
```

```
    # Modoboa installed from scratch would not contain any such
    # files, but you never know what the future holds.
    location ~ /\.ht {
        deny all;
    }

    location / {
        include uwsgi_params;
        uwsgi_pass unix:/run/uwsgi/app/modoboa/socket;
        uwsgi_param UWSGI_SCRIPT instance.wsgi:application;
        uwsgi_param UWSGI_SCHEME https;
    }

    location /rspamd/ {
        proxy_pass       http://localhost:11334/;
        proxy_set_header Host      $host;
        proxy_set_header X-Forwarded-For $proxy_add_x_forwarded_for;
    }
}
```

5.2. uwsgi

et le fichier nécessaire pour uwsgi (à adapter à votre utilisation):

```
[uwsgi]
plugins = python
chdir = /chemin/vers/modoboa/<instance>
venv = /chemin/vers/env
module = <instance>.wsgi:application
master = true
harakiri = 60
processes = 2
vhost = true
no-default-app = true
```

Je précise qu'il faudra modifier la configuration TLS par défaut de nginx que je trouve trop lâche mais je vous laisse faire vos choix.

6. Rspamd

6.1. Configuration

Les fichiers de configuration de rspamd ne doivent pas être modifiés, il faut soit les compléter (dossier local.d) ou les remplacer (override.d), une configuration sera proposée mais elle peut être à adapter au cas par cas.

>/etc/rspamd/rspamd.conf.local<

```
worker "log_helper" {
  count = 1;
}

multimap {
    # ip - matches source IP of message (radix map)
    # from - matches envelope from (or header From if envelope from is
absent)
    # rcpt - matches any of envelope rcpt or header To if envelope info is
missing
    # header - matches any header specified (must have header = "Header-
Name" configuration attribute)
    # dnsbl - matches source IP against some DNS blacklist (consider using
RBL module for this)
    local_bl_ip { type = "ip"; map = "$CONFDIR/local.d/local_bl_ip.map.inc";
symbol = "LOCAL_BL_IP"; description = "Local ip blacklist";}
    local_bl_from { type = "from"; map =
"$CONFDIR/local.d/local_bl_from.map.inc"; symbol = "LOCAL_BL_FROM";
description = "Local from blacklist";}
    local_bl_rcpt { type = "rcpt"; map =
"$CONFDIR/local.d/local_bl_rcpt.map.inc"; symbol = "LOCAL_BL_RCPT";
description = "Local rcpt blacklist";}
    local_wl_ip { type = "ip"; map = "$CONFDIR/local.d/local_wl_ip.map.inc";
symbol = "LOCAL_WL_IP"; description = "Local ip whitelist";}
    local_wl_from { type = "from"; map =
"$CONFDIR/local.d/local_wl_from.map.inc"; symbol = "LOCAL_WL_FROM";
description = "Local from whitelist";}
    local_wl_rcpt { type = "rcpt"; map =
"$CONFDIR/local.d/local_wl_rcpt.map.inc"; symbol = "LOCAL_WL_RCPT";
description = "Local rcpt whitelist";}
}

metric {
    name = "default";
    group {
        name = "local";
        symbol {
            weight = 3;
            description = "Sender ip listed in local ip blacklist";
            name = "LOCAL_BL_IP";
        }
        symbol {
            weight = 3;
            description = "Sender from listed in local from blacklist";
            name = "LOCAL_BL_FROM";
        }
        symbol {
            weight = 3;
```

```
            description = "Recipient listed in local rcpt blacklist";
            name = "LOCAL_BL_RCPT";
        }
        symbol {
            weight = -10;
            description = "Sender ip listed in local ip whitelist";
            name = "LOCAL_WL_IP";
        }
        symbol {
            weight = -5;
            description = "Sender from listed in local from whitelist";
            name = "LOCAL_WL_FROM";
        }
        symbol {
            weight = -5;
            description = "Recipient listed in local rcpt whitelist";
            name = "LOCAL_WL_RCPT";
        }
    }

}
```

Les fichiers créés pour l'occasion:

> /etc/rspamd/local.d/antivirus.conf <

```
# multiple scanners could be checked, for each we create a configuration
block with an arbitrary name
clamav {
  enabled = true;
  # If set force this action if any virus is found (default unset: no action
is forced)
  action = "reject";
  # if `true` only messages with non-image attachments will be checked
(default true)
  attachments_only = false;
  # If `max_size` is set, messages > n bytes in size are not scanned
  #max_size = 20000000;
  # symbol to add (add it to metric if you want non-zero weight)
  symbol = "CLAM_VIRUS";
  # type of scanner: "clamav", "fprot", "sophos" or "savapi"
  type = "clamav";
  # If set true, log message is emitted for clean messages
  #log_clean = false;
  # For "savapi" you must also specify the following variable
  #product_id = 12345;
  # For "savapi" you can enable logging for clean messages
  log_clean = true;
  # servers to query (if port is unspecified, scanner-specific default is
```

```
used)
  # can be specified multiple times to pool servers
  # can be set to a path to a unix socket
  servers = "127.0.0.1:3310";
  # if `patterns` is specified virus name will be matched against provided
regexes and the related
  # symbol will be yielded if a match is found. If no match is found,
default symbol is yielded.
  patterns {
    # symbol_name = "pattern";
    JUST_EICAR = "^Eicar-Test-Signature$";
  }
  # `whitelist` points to a map of IP addresses. Mail from these addresses
is not scanned.
  #whitelist = "/etc/rspamd/antivirus.wl";
}
```

> /etc/rspamd/local.d/arc.conf <

```
# local.d/arc.conf

# If false, messages with empty envelope from are not signed
allow_envfrom_empty = false;
# If true, envelope/header domain mismatch is ignored
allow_hdrfrom_mismatch = false;
# If true, multiple from headers are allowed (but only first is used)
allow_hdrfrom_multiple = true;

q1 et q2 sont les mots de passe à modifier.

6.2. Commandes utiles

Changer les mots de passe q1 et q2:

```
rspamadm pw
```

Générer une clef privée qui doit être absolument être lisible par l'utilisateur _rspamd_ :

```
rspamadm dkim_keygen -s 'mail' -d domaine.tld
```

avec l'option -s désignant le sélecteur qui doit **impérativement être le même que celui de votre enregistrement DNS** sans quoi la signature de vos messages ne servira à rien.
